

# Expanding the BAO science case

Florian Beutler

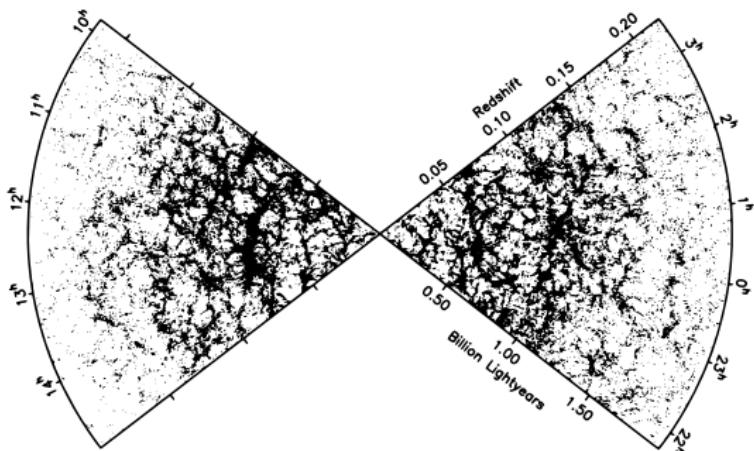

Royal Society University Research Fellow

# Outline of the talk

- ① General introduction to galaxy redshift surveys & BAO
- ② Testing inflation with primordial features ([arXiv:1906.08758](https://arxiv.org/abs/1906.08758))
- ③ Neutrinos in the phase of the BAO ([arXiv:1803.10741](https://arxiv.org/abs/1803.10741))

# What is a galaxy redshift survey?

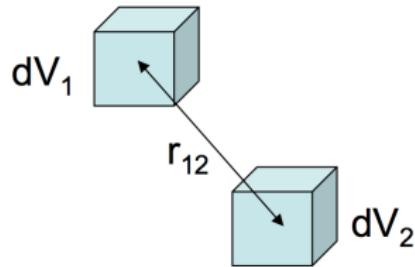

- Measure the position of galaxies (redshift + RA, DEC).
- The CMB tells us a lot about the initial conditions for today's distribution of matter.
- How the initial density fluctuations in the CMB evolved from redshift  $z \sim 1100$  to today depends on  $\Omega_m$ ,  $\Omega_\Lambda$ ,  $H_0$  etc.

# From a point distribution to a power spectrum

- Overdensity-field:

$$\delta(\mathbf{x}) = \frac{\rho(\mathbf{x}) - \bar{\rho}}{\bar{\rho}}$$

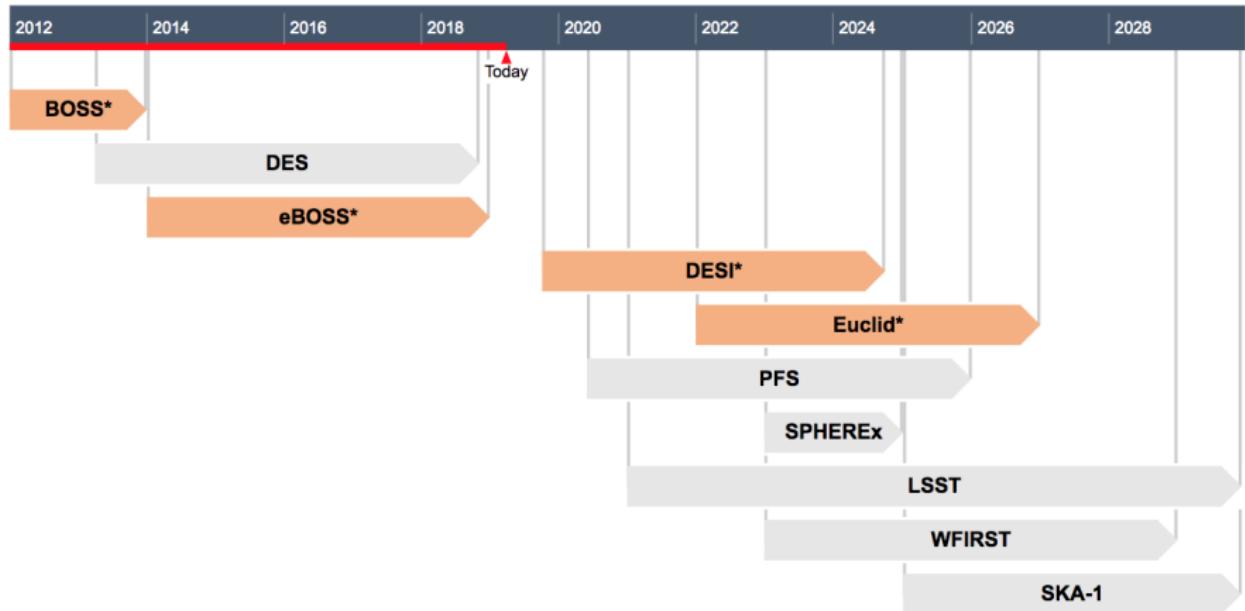

- Two-point function:

$$\xi(\mathbf{r}) = \langle \delta(\mathbf{x} + \mathbf{r}) \delta(\mathbf{x}) \rangle \begin{cases} \text{homogeneity} \\ \text{isotropy} \\ \text{anisotropy} \end{cases} = \xi(r)$$
$$\xi_\ell(r) = \int_{-1}^1 d\mu \xi(r, \mu) \mathcal{L}_\ell(\mu)$$

- ...and in Fourier-space:

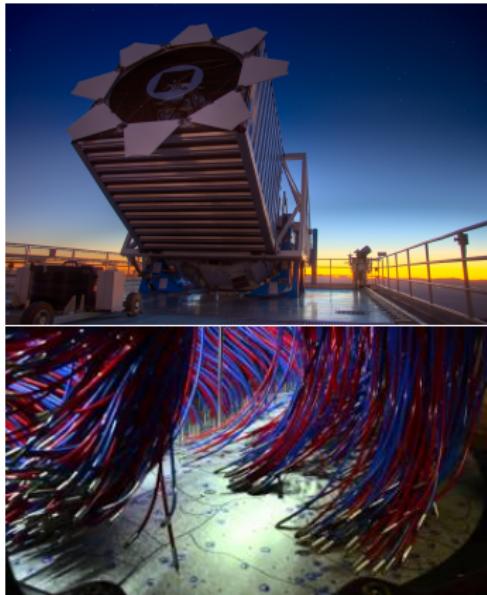

$$P_\ell(k) = 4\pi(-i)^\ell \int r^2 dr \xi_\ell(r) j_\ell(kr)$$

# Why should you care?

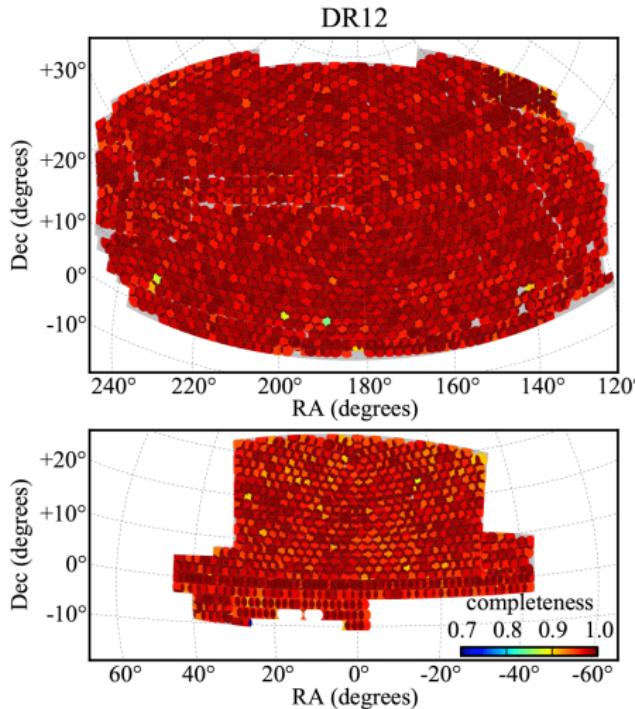

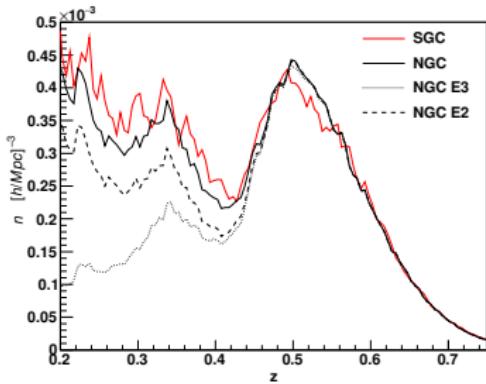

# The BOSS galaxy survey

- Third version of the Sloan Digital Sky Survey (SDSS-III)
- Spectroscopic survey optimized for the measurement of Baryon Acoustic Oscillations (BAO)
- The galaxy sample includes 1 100 000 galaxy redshifts in the range  $0.2 < z < 0.75$
- The effective volume is  $\sim 6 \text{ Gpc}^3$
- 1000 fibres/redshifts per pointing

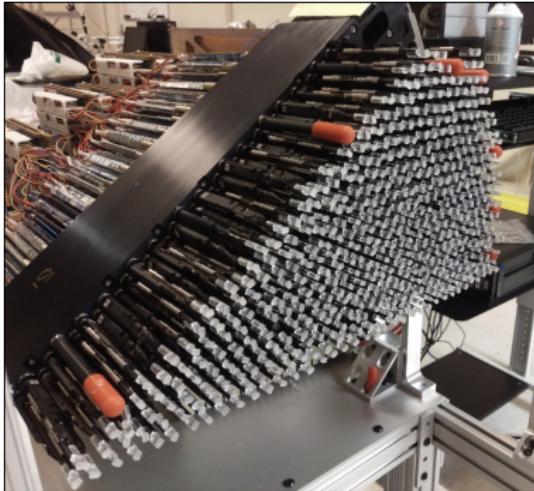

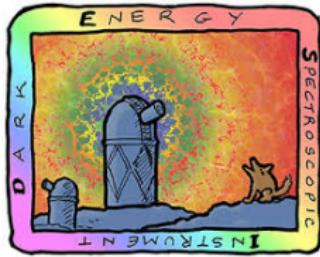

# The BOSS galaxy survey

- The final data release (DR12) covers about  $10\,000 \text{ deg}^2$
- The survey is divided in a north galactic patch (NGC) and a south galactic patch (SGC).

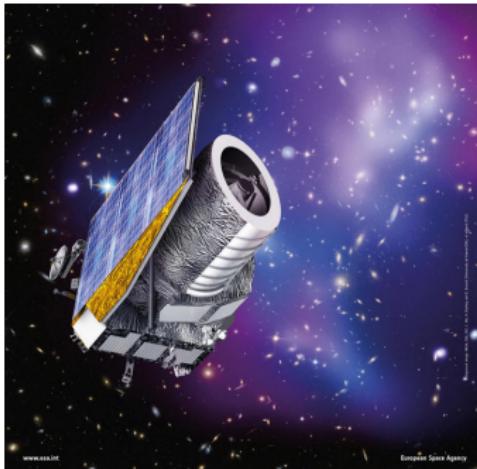

# The DESI galaxy survey

- Mayall 4m telescope at Kitt Peak, Arizona
- 5000 fibres/pointing
- Will observe 3 types of galaxies (LRGs/ELGs/QSOs) + BGS
- 30 - 40 million galaxies in total
- $z < 1.8$  with galaxies and  $z < 3.5$  with Ly- $\alpha$  forest

# The ESA Euclid mission

- Launch scheduled for summer 2022  
→ L2 point
- Space-based weak lensing + gal.  
clustering survey over  $15\,000 \text{ deg}^2$
- 30 million emission line galaxies  
over the redshift range 0.7 to 2.0
- Slitless spectroscopy (grism)

# What are Baryon Acoustic Oscillations?

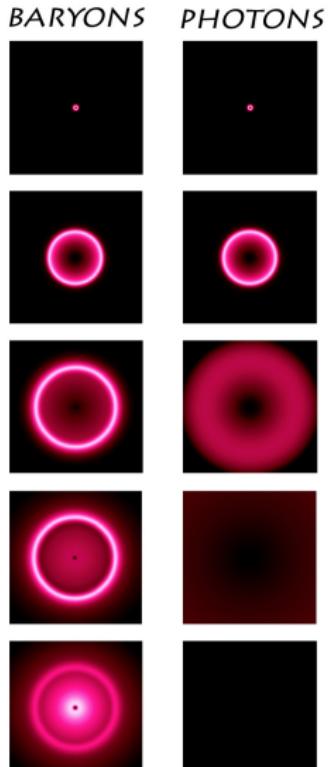

- For the first 380 000 years the evolution eq. of baryon and photon perturbations can be written as

$$\ddot{\delta}_{b\gamma} - c_s^2 \nabla^2 \delta_{b\gamma} = \nabla^2 \Phi$$

with the plane wave solution

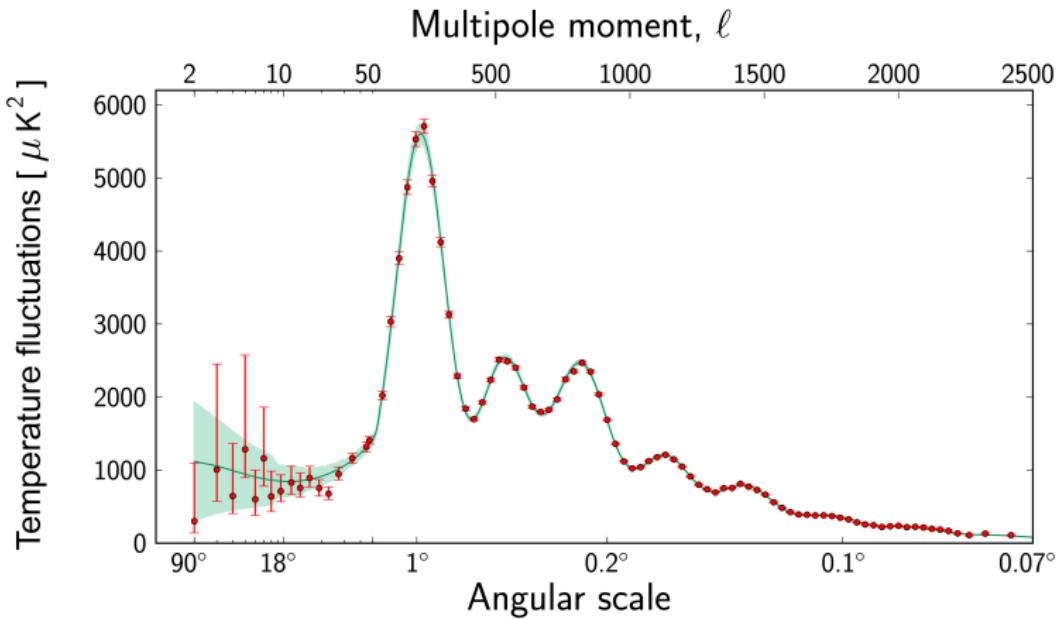

$$\delta_{b\gamma} = A \cos(kr_s + \phi)$$

- Preferred distance scale between galaxies as a relic of sound waves in the early Universe.
- This signal is present at low redshift and detectable in  $\xi(r)/P(k)$  **on very large scales**.

credit: Martin White

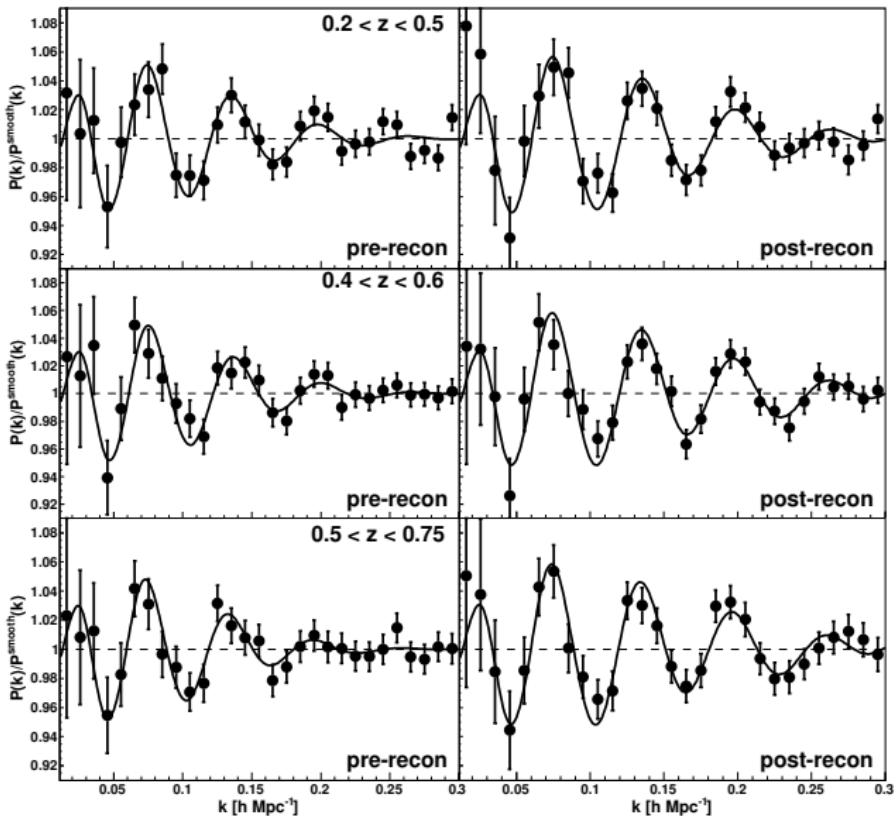

# What are Baryon Acoustic Oscillations?

$$r_s(z_*) = 144.75 \pm 0.66 \text{ Mpc} \quad (0.46\%)$$

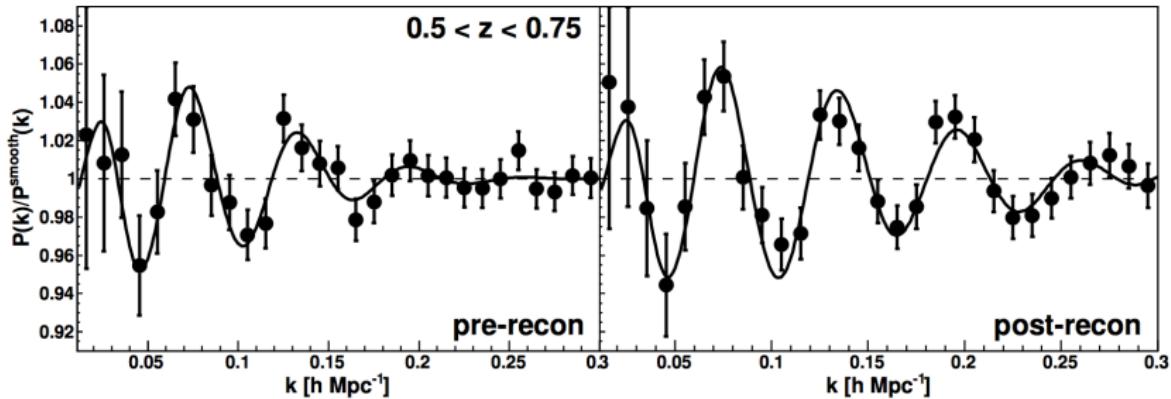

$$r_s(z_d) = 147.34 \pm 0.64 \text{ Mpc} \quad (0.43\%)$$

# Baryon Acoustic Oscillations in BOSS

Beutler et al. (2017)

# Baryon Acoustic Oscillations in BOSS

$$D_A(z) = \int_0^z \frac{cdz'}{H(z')}$$

$$H(z) = H_0 \sqrt{\Omega_m(1+z)^3 + \Omega_\Lambda + \Omega_k(1+z)^2}$$

$$D_V(z) = \left[ (1+z)^2 D_A^2(z) \frac{cz}{H(z)} \right]^{1/3}$$

# Fitting the BAO

- Start with linear  $P(k)$  and separate the broadband shape,  $P^{\text{sm}}(k)$ , and the BAO feature  $O^{\text{lin}}(k)$ . Include a damping of the BAO feature:

$$P^{\text{sm,lin}}(k) = P^{\text{sm}}(k) \left[ 1 + (O^{\text{lin}}(k/\alpha) - 1)e^{-k^2 \Sigma_{\text{nl}}^2 / 2} \right]$$

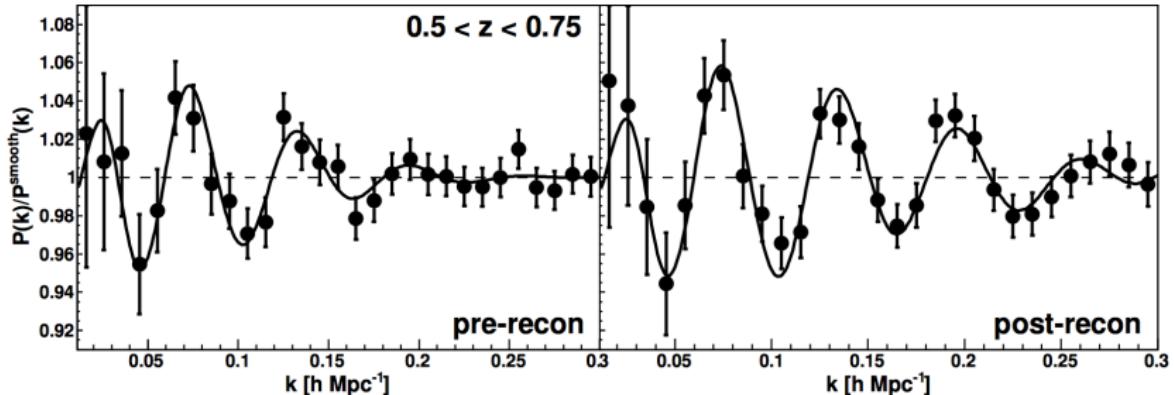

- Add broadband nuisance terms

$$A(k) = a_1 k + a_2 + \frac{a_3}{k} + \frac{a_4}{k^2} + \frac{a_5}{k^3}$$

$$P^{\text{fit}}(k) = B^2 P^{\text{sm,lin}}(k/\alpha) + A(k)$$

- Marginalize to get  $\mathcal{L}(\alpha)$ .

# Baryon Acoustic Oscillations in BOSS

$$D_V(z = 0.38) r_s^{\text{fid}}/r_s = 1476 \pm 15 \text{ Mpc} \quad (1.0\%)$$

$$D_V(z = 0.61) r_s^{\text{fid}}/r_s = 2146 \pm 19 \text{ Mpc} \quad (0.9\%)$$

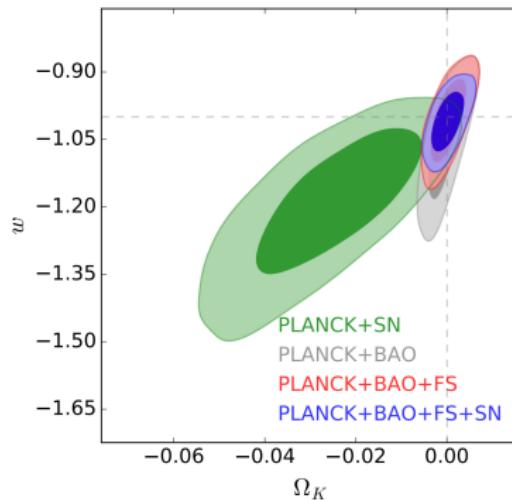

$$D_V(z) = \left[ (1+z)^2 D_A^2(z) \frac{cz}{H(z)} \right]^{1/3}$$

# Baryon Acoustic Oscillations in BOSS

- The BAO signal is located on very large scales and can be captured (mostly) with a linear model.
- In BOSS we used an agnostic broadband marginalisation using a set of polynomial terms and density field reconstruction to boost the signal.
- Due to BAO we now know the distance to  $z = 0.38$  and  $z = 0.61$  with  $\sim 1\%$  uncertainty... **better than our knowledge of  $H_0$ .**

# Baryon Acoustic Oscillations in BOSS

- The BAO signal is located on very large scales and can be captured (mostly) with a linear model.
- In BOSS we used an agnostic broadband marginalisation using a set of polynomial terms and density field reconstruction to boost the signal.
- Due to BAO we now know the distance to  $z = 0.38$  and  $z = 0.61$  with  $\sim 1\%$  uncertainty... **better than our knowledge of  $H_0$ .**

Alam et al. (2017)

Planck+SN:

$$\Omega_k = 0.025 \pm 0.012$$

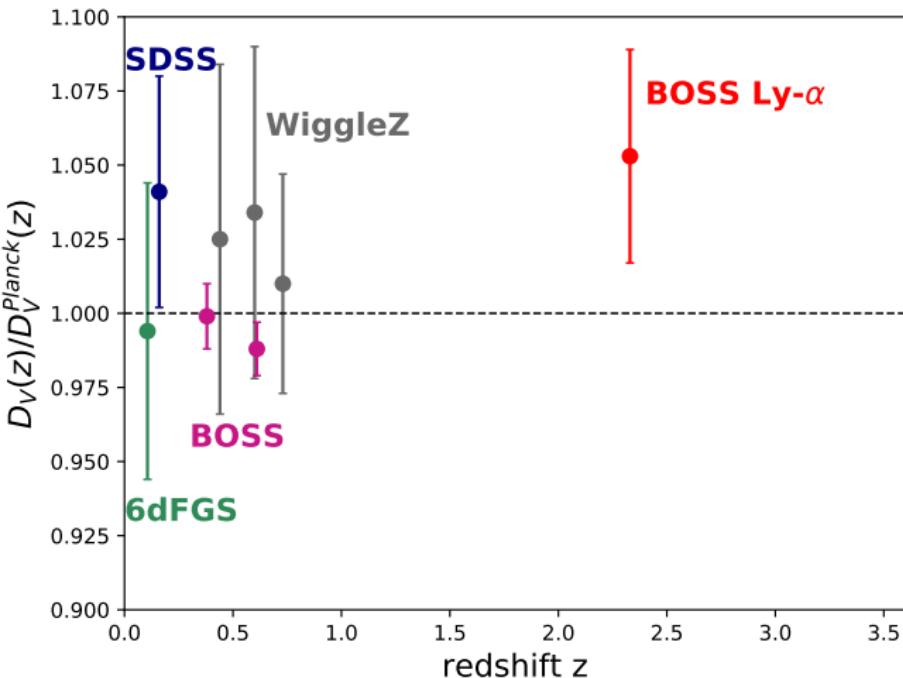

$$w = -1.01 \pm 0.11$$

Planck+SN+BAO:

$$\Omega_k = 0.0003 \pm 0.0027$$

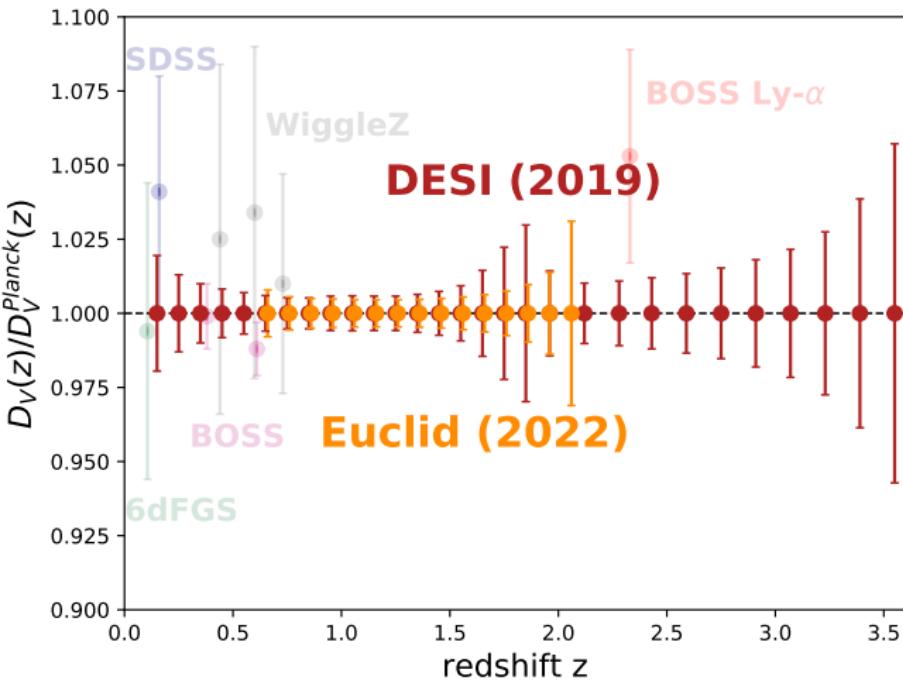

$$w = -1.05 \pm 0.08$$

# Looking into the (near) future

$$D_V(z) = \left[ (1+z)^2 D_A^2(z) \frac{cz}{H(z)} \right]^{1/3}$$

# Looking into the (near) future

$$D_V(z) = \left[ (1+z)^2 D_A^2(z) \frac{cz}{H(z)} \right]^{1/3}$$

# First Measurement of Neutrinos in the BAO Spectrum

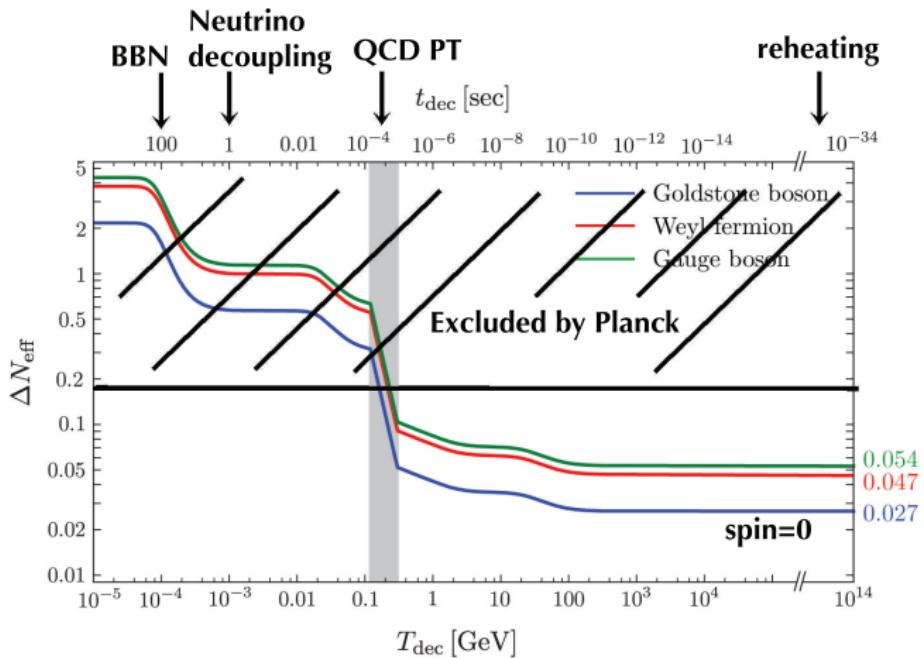

Daniel Baumann, Florian Beutler, Raphael Flauger, Daniel Green, Mariana Vargas-Magana, Anze Slosar, Benjamin Wallisch, Christophe Yèche  
Nature Physics, 15, 465 (2019)

# Motivation: Neutrinos in the phase of the BAO

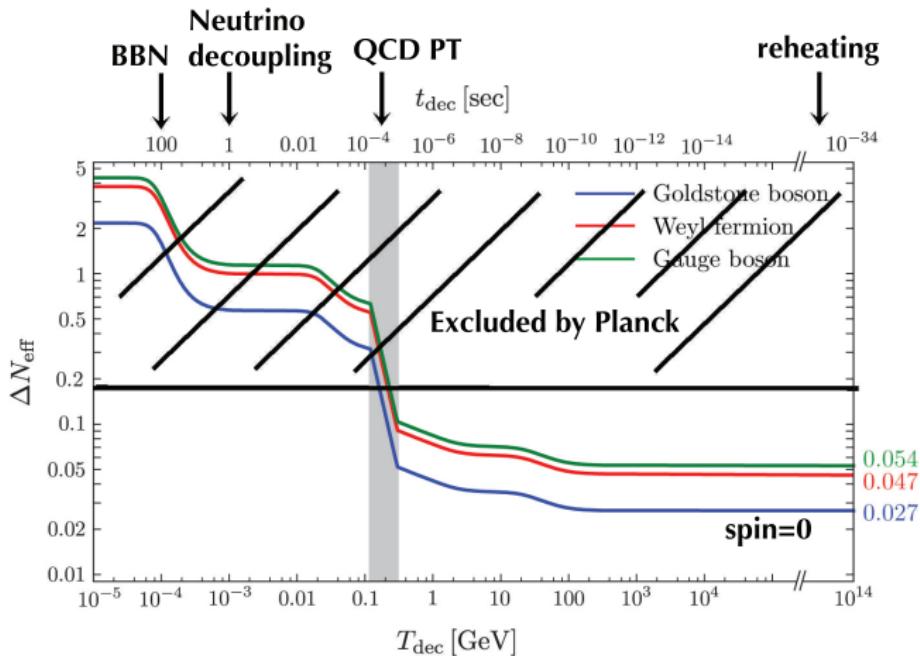

$$\rho_r = \left[ 1 + \frac{7}{8} \left( \frac{4}{11} \right)^{4/3} N_{\text{eff}} \right] \rho_\gamma$$

# Motivation: Neutrinos in the phase of the BAO

$$N_{\text{eff}} = 3.04 \pm 0.18 \quad (\text{Planck})$$

# Motivation: Neutrinos in the phase of the BAO

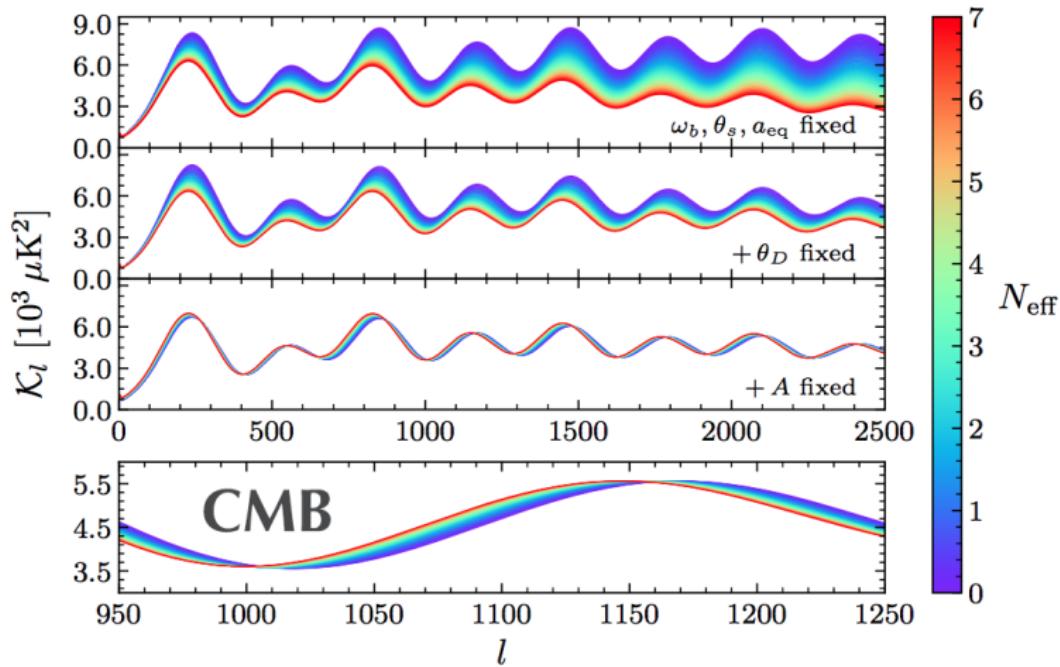

$$\sigma(N_{\text{eff}}) = 0.030 \quad (\text{CMB-S4})$$

$$\sigma(N_{\text{eff}}) = 0.027 \quad (\text{CMB-S4} + \text{Euclid})$$

Baumann et al. (2017)

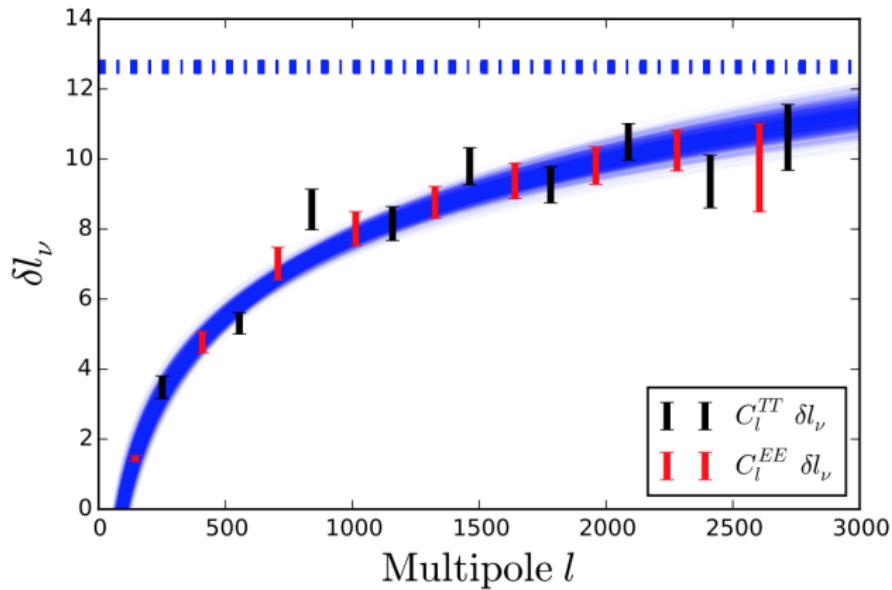

# Neutrinos in the CMB Spectrum

Current constraints are dominated by the damping of the power spectrum (degenerate with helium fraction).

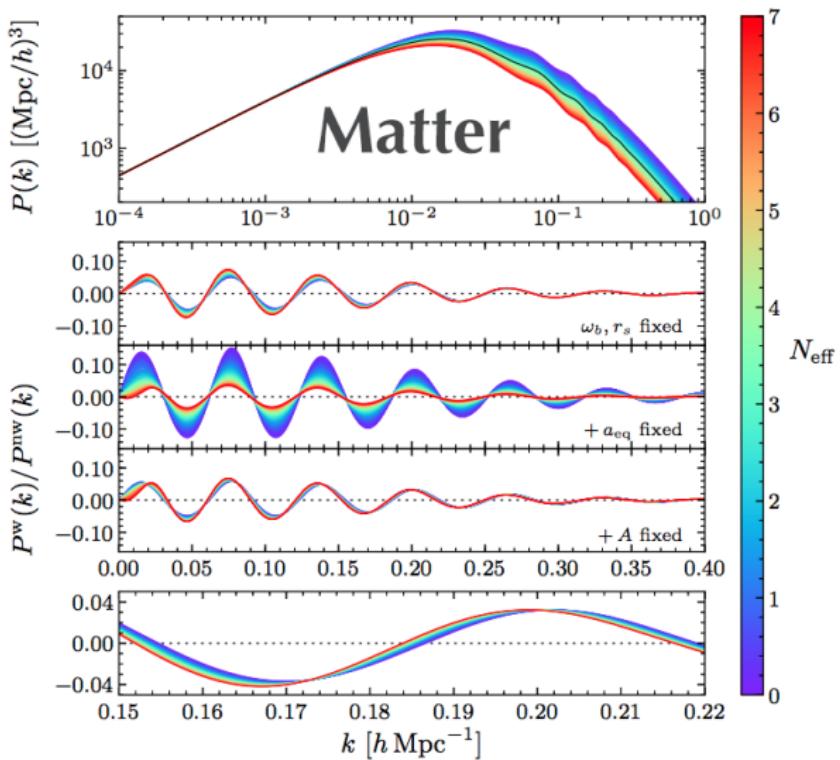

# Phase shift detection in the CMB

The Phase shift has recently been detected in the temperature and polarisation CMB spectrum.

$$N_{\text{eff}} = 2.8^{+1.1}_{-0.4}$$

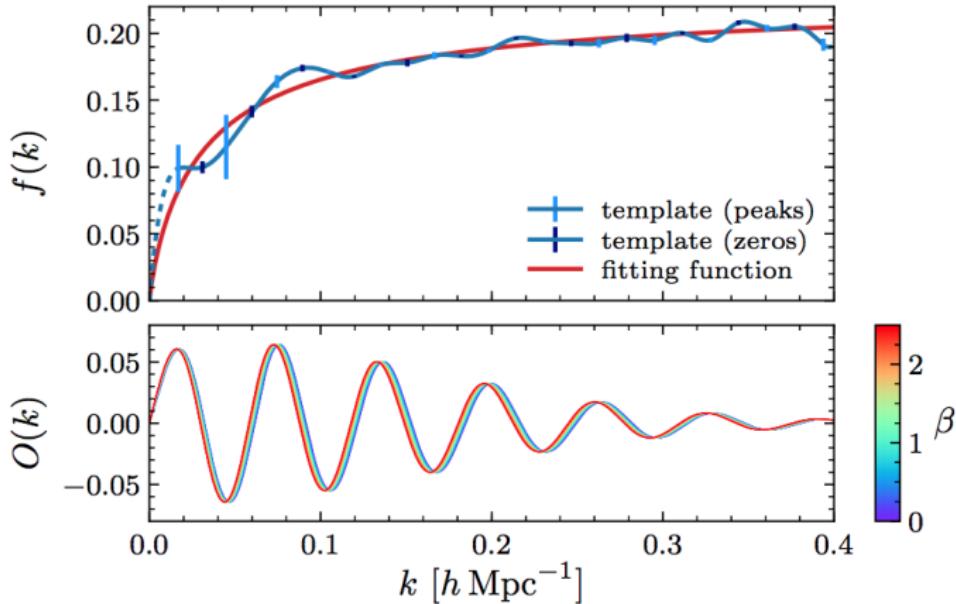

# Neutrinos in the BAO Spectrum

Baumann et al. (2017)

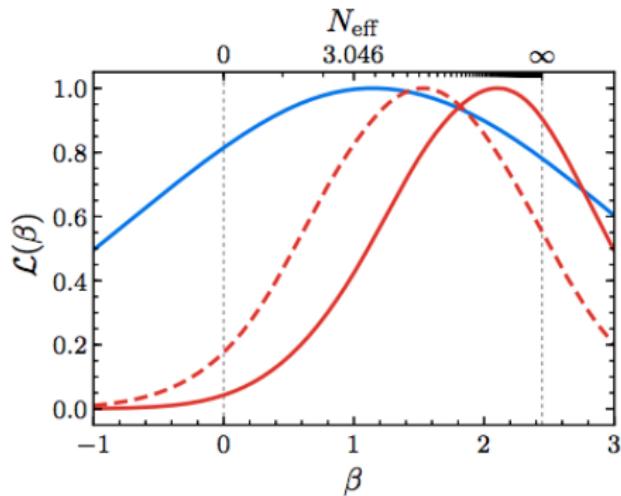

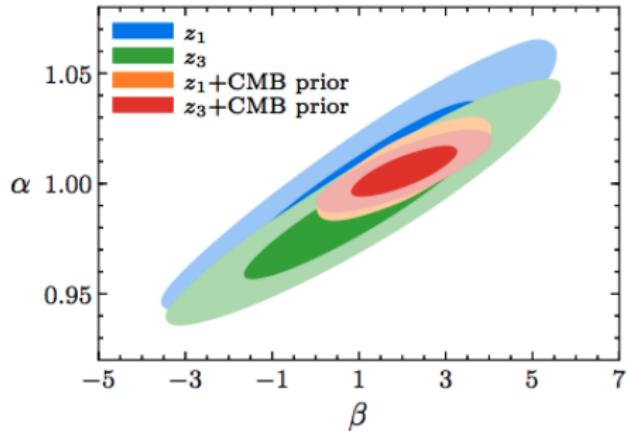

# Neutrinos in the BAO Spectrum

$$O(k) = O_{\text{lin}}(k/\alpha + (\beta - 1)f(k)/r_s^{\text{fid}}) e^{-k^2 \sigma_{\text{nl}}^2/2}$$

# Neutrinos in the BAO Spectrum

$$O(k) = O_{\text{lin}}(k/\alpha + (\beta - 1)f(k)/r_s^{\text{fid}}) e^{-k^2 \sigma_{\text{nl}}^2/2}$$

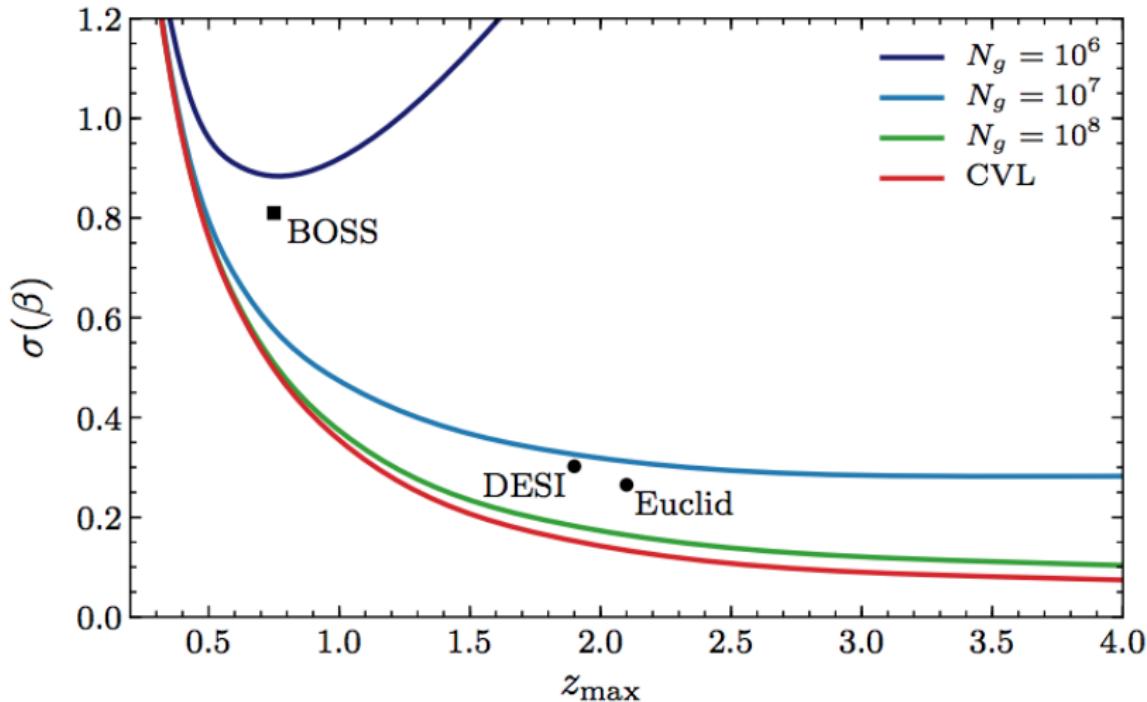

$$\beta(N_{\text{eff}}) = \frac{\epsilon}{\epsilon_{\text{fid}}} \quad \text{with}$$

$$\epsilon = \frac{N_{\text{eff}}}{8(11/4)^{4/3}/7 + N_{\text{eff}}}$$

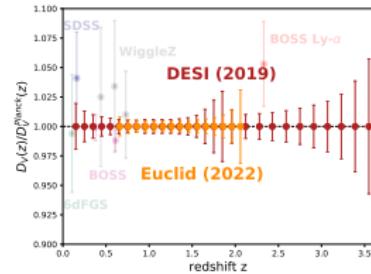

→ Proof of principle!

Baumann et al. (2019)

# Neutrinos in the BAO Spectrum

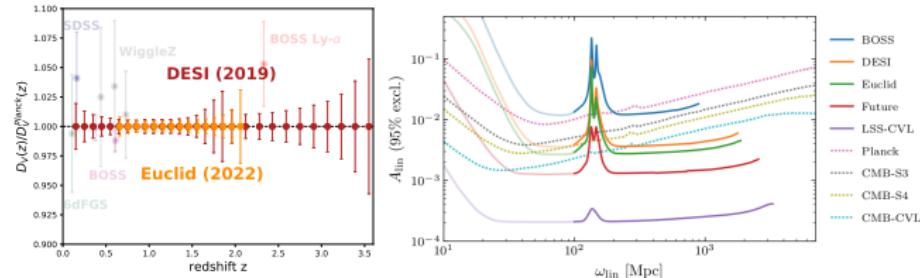

# Summary

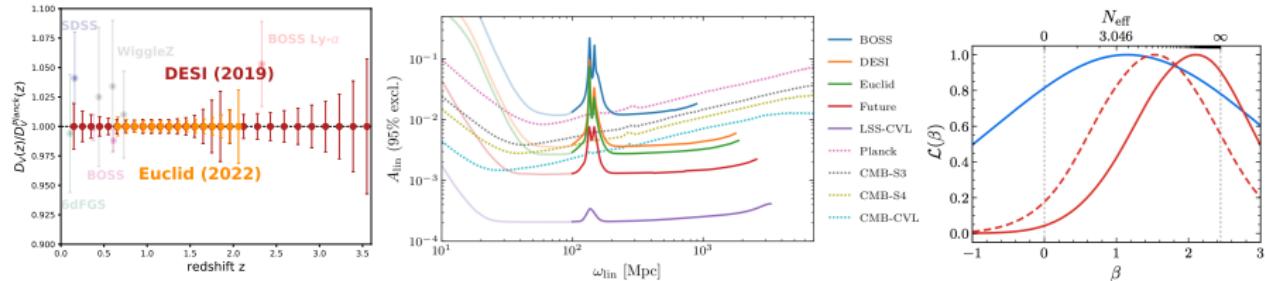

- 1 The next generation of galaxy redshift surveys is just around the corner  
→ with **BAO as a key science case**

# Summary

- ① The next generation of galaxy redshift surveys is just around the corner  
→ with **BAO as a key science case**
- ② The BAO analysis pipeline is **perfectly suited to extract primordial features** to test inflation
- ③ Constraints on primordial features from LSS are **already better than Planck** for a large frequency range

# Summary

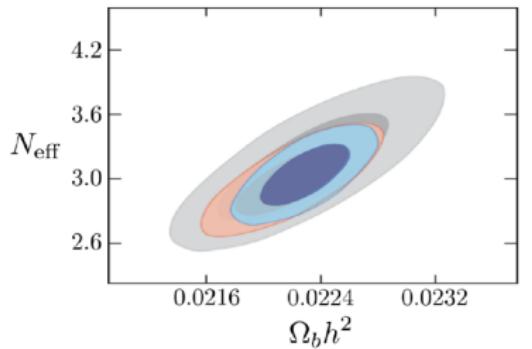

- ① The next generation of galaxy redshift surveys is just around the corner  
→ with **BAO as a key science case**
- ② The BAO analysis pipeline is **perfectly suited to extract primordial features** to test inflation
- ③ Constraints on primordial features from LSS are **already better than Planck** for a large frequency range
- ④ The **phase of the BAO** carries information on  $N_{\text{eff}}$  just as in the CMB  
→ **first (low significance) detection in BOSS**

# Current constraints on $N_{\text{eff}}$

Relic neutrinos make up 41% of the radiation density

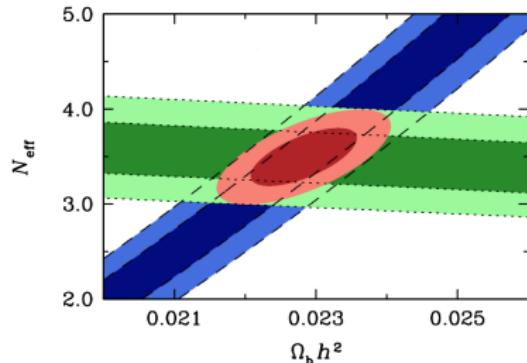

$$\rho_r = \left[ 1 + \frac{7}{8} \left( \frac{4}{11} \right)^{4/3} N_{\text{eff}} \right] \rho_\gamma$$

CMB

$$N_{\text{eff}}^{\text{CMB}} = 3.04 \pm 0.18$$

BBN

$$N_{\text{eff}}^{\text{BBN}} = 3.28 \pm 0.28$$
